# Introduction

S

# The planetary atmospheric circulation of troposphere in the Northern hemisphere

Mean field 500hPa for period 1967-1982 (Zverev N.I., 1987)

A planetary atmospheric circulation of troposphere in the Northern Hemisphere is the three-vortex system.

This system consists of three ridges in the winter: North Atlantic, Siberian (in the summer, it is thermal) and Canadian maximums of pressure. The European, Aleutian and Iceland minimums are placed between maximums.

As a rule, all changes of one pair of minimum and maximum of pressure are connected with the changes of the other.

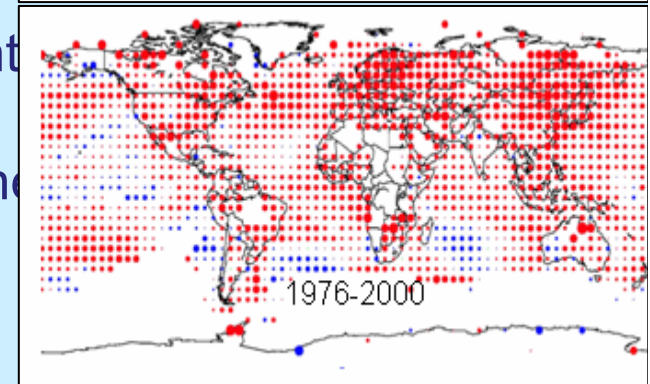

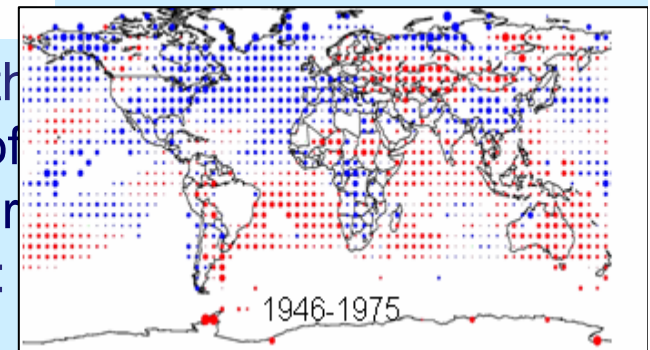

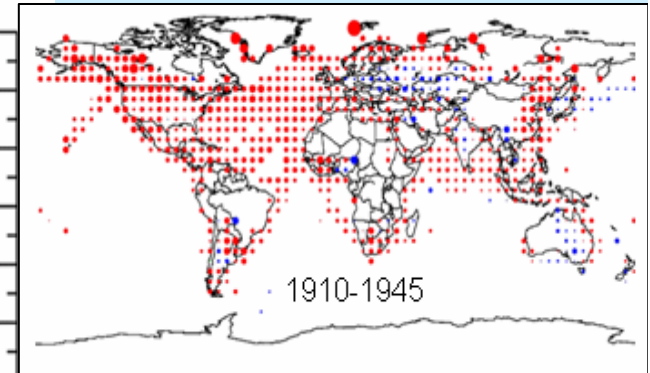

Regional circulation has to research on area equal on extent from the west to the east 120 degrees.

# THE GLOBAL TEMPERATURE DURING XXth CENTURY

Global warming was register from beginning of 20th century to the present tense. For our study of change sea-level pressure fields during XXth century we mark three periods in global temperature trend :

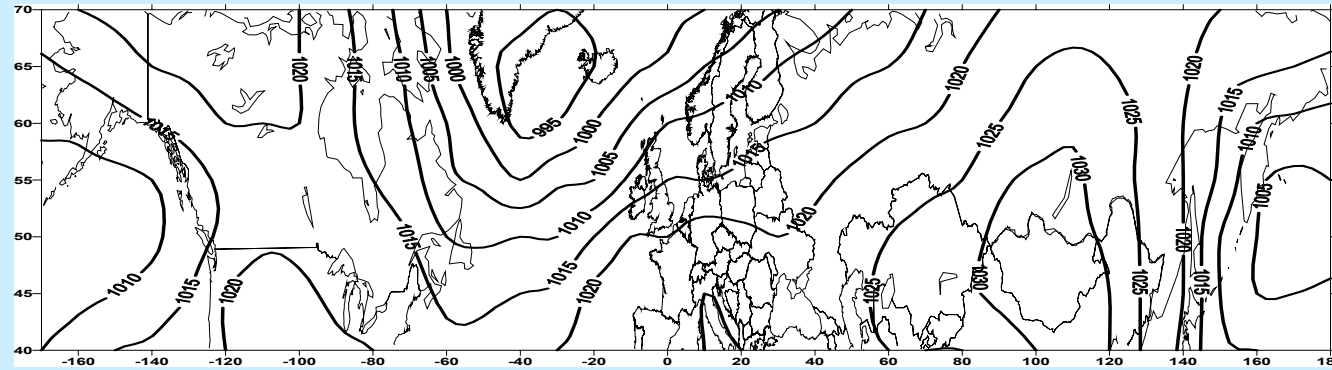

- **first warming** is within period of 1911-1944
  - **second warming** is since the end of the 1970s until now
  - **period of the** near stable temperature between the
- Each period is about 30 years.

## The latitudinal average sea-level pressure fields ( $\bar{P}$ )

If the pressure fields written as a matrix  $P$  with elements  $p_{ij}$  which correspond to values of pressure in the point  $j$  and  $i$  of a regular grid of field of our archive for every decade, then

$$\bar{p}_j = \frac{1}{n} \sum_{i=1}^N p_{ij}$$

$\bar{P} = (\bar{p}_1 \quad \bar{p}_2 \quad \dots \quad \bar{p}_j \quad \dots \quad \bar{p}_{n-1} \quad \bar{p}_n)$  is latitudinal average sea-level pressure field.

The field of pressure 1900-1909

$\bar{P}_1$  1900-1909

# Historical Records of Asian Dust Events in Korea

Youngsin Chun

Meteorological Research Institute, Seoul, KOREA

Asian Dust

For the understanding of dust phenomena over Korea, climatological dust records were analyzed and compiled. Statements regarding dust events were extracted from ancient books and thoroughly examined to collect as much reliable data as possible.

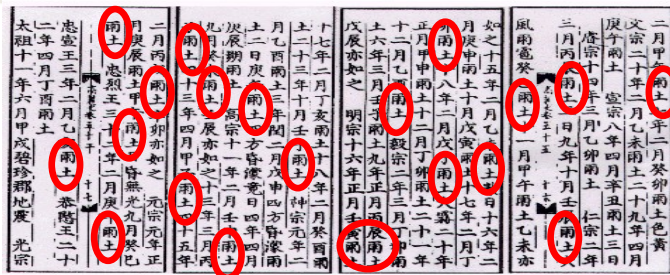

<http://yellow.metri.re.kr>

Period of the Three Kingdoms (BC 57 - AD 938)

| YEAR | MONTH (Lunar) | KINGDOM       | ORIGINAL RECORD | MEANING  |
|------|---------------|---------------|-----------------|--|
| 174  | 1             | Silla         | 雨土              | Dust fell like rain.   |
| 299  | 10            | Goguryeo      | 黃霧四塞            | Yellow fog in all directions   |
| 379  | 4             | Baekje        | 雨土竟日            | Dust fell all day.   |
| 389  | 2             | Silla         | 雨土              | Dust fell like rain.   |
| 500  | 4             | Silla         | 京都黃霧四塞          | There was yellow fog in all directions in Gyeongju, Silla's capital. |
| 606  | 3             | Baekje        | 王都雨土晝暗          | The sky of Baekje's capital was darkened like night by dustfall.     |
| 627  | 3             | Silla         | 大風雨土過五日         | Dust storm lingered over five days.                                  |
| 644  | 10            | Goguryeo      | 平壤雪色赤           | Snow tinged with red in Pyongyang.                                   |
| 770  | 3             | Unified Silla | 雨土              | Dust fell like rain.   |
| 780  | 1             | Unified Silla | 黃霧              | Yellow fog   |
| 780  | 2             | Unified Silla | 雨土              | Dust fell like rain.   |
| 850  | 1             | Unified Silla | 京都雨土            | Dust fell in Gvungeo, Silla's capital.                               |

→ Dustfall

“Woo-Tou” are recorded in Goryeo sa. At this time, almost all events were observed in the capital. Out of these records, 50 were about a dust event during from AD 918 to 1392.

AD850

Prisoners were set free in Silla after the occultation of Saturn by the moon and a dustfall with very fine particles in AD 850. Definition written in Sounkwonji which is a treatise published in 1818 dealing with astronomy.

The day number of dust events extracted from historical literature from 1 to 18 century.

During the 16<sup>th</sup> century, the largest number of dust events was recorded. However, no record was found for 43 years before and after the war between Korea and Japan in 1592.

AD1818

The last historical event was documented in 1784.

The occurrence of dust events mostly concentrated in springtime. March in lunar calendar is almost corresponding to April of solar one.

Even in winter Asian dust events are observed occasionally.

Records of Asian dust events were extracted from the historical chronicles of Korea: Samguk sagi (BC 57 - AD 938), Goryeo sa (918-1392), and Joseon wangjo sillok (1392-1853) and Munhuenbigo (~ 1776). 160 records were retrieved for the period encompassed by the above literature since the first record made in AD 174. Dust events were most frequently called “Woo-Tou” written in Chinese letters. The records show that Asian dust events took place most often during springtime and there was no occurrence during summertime. It is found that this pattern is similar to that of the past century.

# Asian Dust Events in Korea for Recent 100 Years

**Youngsin Chun, Kyoung Mi Cho**  
 Meteorological Research Institute, Seoul, KOREA

## 1. Introduction

Asian dust days in Korea since 1915 up to 2002 were investigated based on official records of the Asian Dust events.

## 2. Data and analysis method

Monthly report of weather phenomenon was searched page by page to find Asian Dust event.

April 1941, Seoul

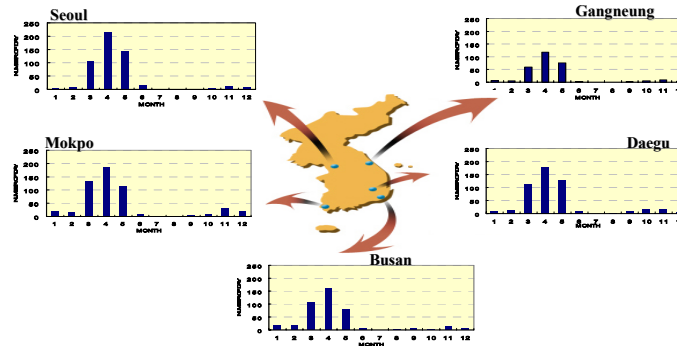

April 1921, Gangneung

## 3. Results

### Asian Dust code change

1915년 - 1922년 - 1956년 - present

Three different ways recording the Asian Dust events were found : Chinese character in 1915, code which looks like infinitive with underbar (e.g.,  $\infty$ ) from 1922 to 1955, and  $\infty$  within a box (e.g.,  $\infty$ ) after 1956 until now. Based on these three dust codes, recent 100 year's Asian Dust days were analyzed.

| Station   | Month |     |      |      |      |     |   |     |     |     |     |     | unit, % |

The occurrence of dust events mostly concentrated in springtime showing 85% frequency during recent 100 years. April is the best season to observe Asian Dust events. Even in winter months from November to February, Asian Dust events are observed occasionally.

There was a distinct warm period of northern China in 1930's and 1940's.

Furthermore dust storm occurred in America many times during 1930's because of the severe drought and desertification (UNEP, 1997).

There is two peaks in late 1930's and recent year. These characteristics are shown at 5 stations.

 Kyoung Mi Cho : lightow@metri.re.kr , METRI, KOREA

- ### 4. Summary
- a. The large number of Asian Dust days appeared mainly from 1930's to early 1940's. ( Severe dust year : 1941 (41 days) in Seoul, 1940 & 1942 (21 days) in Mokpo, 1941 (31 days) in Busan, 1936 (33 days) in Daegu, 1936 (24 days) in Gangneung.)
  - b. Average number of Asian Dust days were 5.8 in Seoul, 6.1 in Mokpo, 4.2 in Busan, 5.2 in Daegu and 3.3 in Gangneung a year.
  - c. Occurrence frequency in springtime : 89.1% in Seoul, 78.1% in Mokpo,

The second field-etalon 500hPa

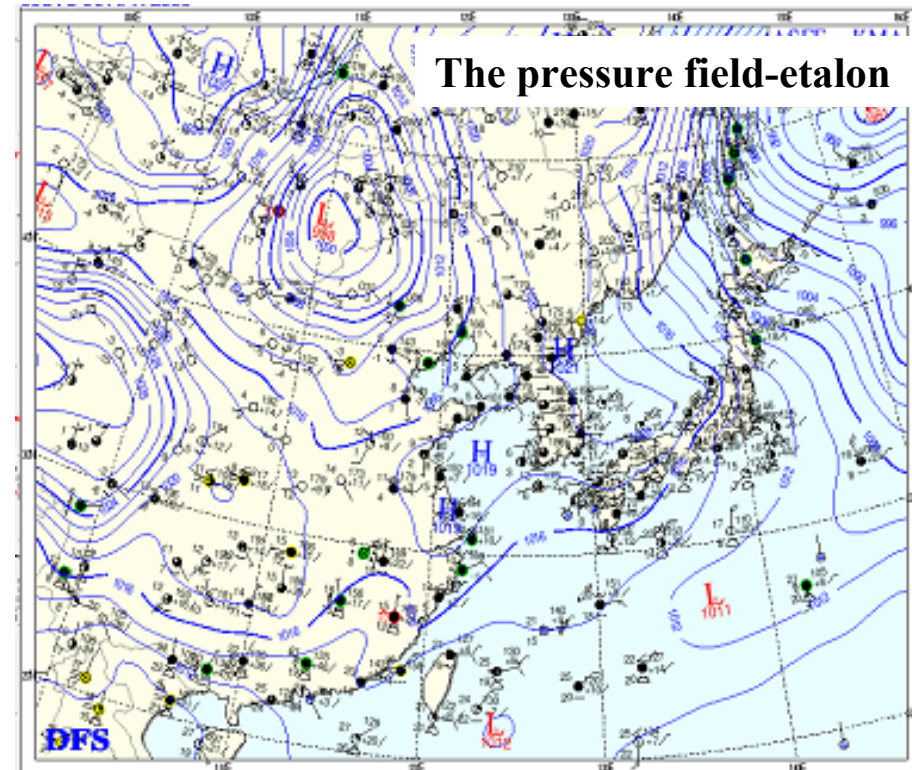

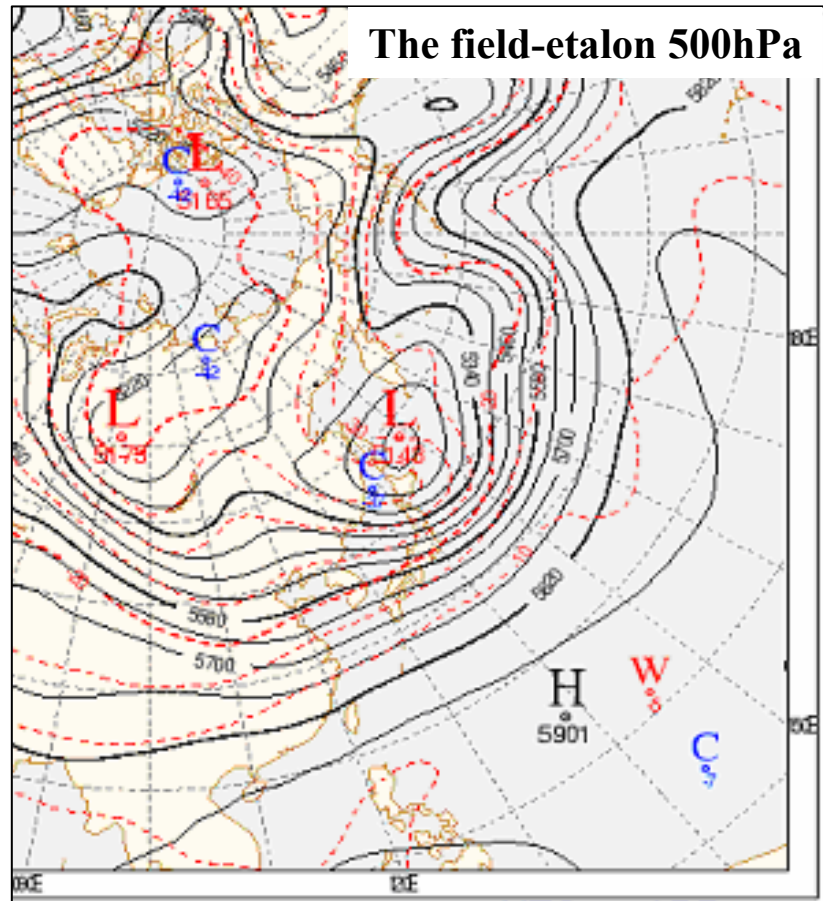

The pressure second field-etalon

# Etalon of class of synoptic situation for forecast of the “yellow sand” event in the next day in Korea

The synoptic situation of the “yellow sand” the next day

- **Conclusions:**
- **Displacement of large-scale atmospheric circulation to the west relative to its equilibrium position (1931-1940gg) at 20 degrees leads to a cooling of virtually all areas of the Northern Hemisphere.**
- **Displacement of large-scale atmospheric circulation to the east relative to its equilibrium position (1931-1940gg) at 20 degrees leads to a warming of virtually all areas of the Northern Hemisphere.**
- **Period of oscillation of large-scale atmospheric circulation is about 50-60 years and corresponds to a shift to the west-east  $\pm$  20 degrees.**
- **In the early twenty-first century, large-scale atmospheric circulation again shifted to the west to the equilibrium, as well as frosty winters, which have become manifest in recent years.**

.

# Conclusions:

1. The greatest number of cases of yellow sand have when you move the circulation from the east through the equilibrium position
2. The extreme shift of the atmospheric circulation to the west leads to a sharp decrease in the number of cases of yellow sand.
3. We must assume that the movement of circulation from the east to the equilibrium state will increase in the incidence of yellow sand in the coming decades.
4. This very important result gives the possibility of long-term benchmark of the nature of particulate air pollution over South Korea in the coming decade.
